To Whom It May Concern:

To gain technical knowledge on the soil characteristics of the clay ground, it is important to perform several tests. Because we have to prepare the field research, we have to know what test equipment are on hand. We are specially looking for the following equipment:

- Manual augers and other drilling devices
- Puls auger
- Weighing scale
- Water level used to determine heights at a distance
- Several sieves/ sifters to determine the particle dimensions of soil samples

Is there a geologic institute or service that has information concerning the target area of Kitui. Do you have their email address? Is it possible to establish contact with the Kenya Soil Survey Department? Could there be arranged a meeting?

Are there any aerial photographs of the target area?

I hope you can help us. We are really looking forward to our stay in Kenya.

With best regards,

Anton Frima
